

Participants needed for a balance research study designed to help develop a better measure of ataxia

Who: Adults over the age of 30 with a positive gene test for SCA1, 2, 3 or 6

What: A research study on developing a more sensitive accurate measure of ataxia

Where: The University of Chicago Medical Center

Time: ~ 2 hours

What is involved: informed consent, answers to questionnaires, a standard neurological examination performed while wearing inertial sensors (similar to Fit-bits).
